During the early 1970s’ Latin America and other regions of the world faced economic and social challenges. The term “dependency” emerged to describe the structural weaknesses that hindered economic growth and development. Dependency theory posited that the economic systems of developing countries were inherently subordinate to those of more developed nations, often through the influence of multinational corporations and the terms of international trade.

Theories of dependency suggested that developed nations, primarily the United States and European countries, controlled the economic and political affairs of less developed countries through financial, military, and cultural means. This control was facilitated through the provision of loans and investments by the United States, which were often conditional on the adoption of policies favorable to the dominant economic interests. Dependency theorists argued that these policies perpetuated the cycle of underdevelopment by limiting the ability of developing countries to create self-sustaining growth and economic independence.

The term "dependency" was applied to various economic and social phenomena, including the role of foreign capital in the development of Latin America. Dependency theory provided a framework for understanding the political and economic struggles of developing nations and the ways in which global economic systems perpetuated inequality and underdevelopment.

Dependency theorists emphasized the importance of understanding the broader global context in which economic development occurs. They argued that a failure to consider the role of international economic forces could lead to misguided policies that perpetuated economic dependence. The concept of dependency theory has been influential in shaping policy discussions and international relations, particularly in discussions around the role of international organizations and the implications of globalization on economic development.
