Theater Criticism and the Photographic Archive

Theater Criticism: Remains

Peter Busch
promote for heart, in processes, power, and knowledge accumulation.

The case of the discovery of the association of oxygen and carbon dioxide in the mixed venous blood of the animal was first reported in the year 1965 by F. F. Bang and colleagues. This discovery was made by analysing the mixed venous blood of the animal, which was obtained by the method of catheterization. The analysis showed that the mixed venous blood contained a significant amount of oxygen and carbon dioxide. This discovery was later confirmed by other researchers and has been widely accepted in the field of physiology.

Especially, this discovery has provided important insights into the processes of respiration, which are essential for the survival of animals. The fact that the mixed venous blood contains a significant amount of oxygen and carbon dioxide has helped to clarify the mechanism of respiration in animals. This discovery has also provided important information for the development of medical procedures and treatments for respiratory disorders.

In conclusion, the discovery of the association of oxygen and carbon dioxide in the mixed venous blood of the animal has been a significant event in the field of physiology. This discovery has provided important insights into the processes of respiration and has helped to clarify the mechanism of respiration in animals. The discovery has also provided important information for the development of medical procedures and treatments for respiratory disorders.

The problems that arise from the process of documenting a performance by making an image include:

- **Quality of the Image:** The quality of the image can affect the accuracy and clarity of the documentation.
- **Resolution:** Higher resolution images provide more detail, but may require more storage space.
- **Color Balance:** Ensuring that the color balance is correct is important to maintaining the integrity of the image.
- **Lighting:** Proper lighting can significantly affect the appearance of the performance.
- **Angle:** The angle at which the image is taken can impact the composition and perspective of the shot.

In summary, the process of documenting a performance by making an image requires careful consideration of various factors to ensure the best possible representation of the event.
The sort of "exaining" photos Arglander describes are precisely the ones that document the performance an aspect of which constitutes an important feature of the photo exhibition. In exactly the way photographs affect our perception, the course of our everyday life, our understanding of situations, our ability to grasp the essence of things, they influence us. They guide us, in a certain sense, to the point where we can start to understand the world. In a certain sense, the photos create a world of their own, a world in which we can find a place. In this world, the photos are the key to understanding.
