Engaging sustainability good practice within the curriculum design and property portfolio in the Australian higher education sector

Structured Abstract:

Purpose
The aim of this research is to evaluate the extent which university’s strategic plans affect the level of incorporation of sustainability within the curriculum design and property portfolio.

Design/methodology/approach
This research adopted a case study approach. The case study institution was Deakin University in Australia. This paper used a qualitative research method. Desk-top study included the review of the University’s Strategic Plan, policy agenda on sustainability and the documents on sustainability courses and units. Semi-structured interviews were held with academics who have course development and management responsibility within the university, colleagues who have a sustainability-focused role on estate management and colleagues whose roles are to manage sustainability initiatives at institution level. All interviews were recorded and transcribed. Content analysis was used to analyse the interview data.

Findings
Despite the University having a clear strategic aims and initiatives on the incorporation of sustainability within curriculum design and property portfolio, there is disconnection between policy development and policy implementation. As a result, the incorporation of sustainability varies largely between curricula within the institution. The incorporation of sustainability within the property portfolio is clear and effective. However, within the curriculum it is polarised. The level of incorporation depends on the nature of the course or unit and is largely driven by the initiatives of the individual academic.

Good practice identified in the incorporation of sustainability within the curriculum is to use a problem-based approach supported by real life projects to enhance the students’ authentic learning experience. The good practice for successfully incorporating sustainability into the property portfolio is to have clear vision of what it has planned to achieve and to ensure there is a balance between sustainability and value for money.

Originality/value
This is pioneering research to investigate the incorporation of sustainability into higher education in a more comprehensive way. This paper considered the impact of strategic planning on the incorporation of sustainability within a higher education, on both curriculum design and property portfolio management.

Article Classification:
Research paper

1. Introduction

There is a large body of research discussing sustainability in the higher education sector albeit the main focus is on curriculum design and development alone (Chhokar, 2010; Fenner, 2005; Muijen, 2004; Shephard, 2008). There is also extensive literature providing evidence on how
organisation’s strategic plans can positively impact sustainable development, but they are predominantly focused on other sectors, such as Manufacturing and Retail (Erol et al., 2009; Garetti and Taisch, 2012; Gunasekaran and Spalanzani, 2012; Jones et al., 2005). However, there is a paucity of research on how strategic planning can influence the incorporation of sustainability within the curriculum and property portfolio, such as development, refurbishment, maintenance and management, in the higher education sector. Real estate is one of the key assets for large organisations such as universities. Built environment also has a major impact on sustainability. UNEP SBCI (2009) stated that ‘buildings are responsible for more than 40 percent of global energy use and one third of the global greenhouse gas emissions, both in developed and developing countries’ (p.6). Also, because buildings have a relatively long lifespan, immediate action taken to encourage a sustainable built environment will help to reduce greenhouse gas emissions over the longer term (ibid.).

The aim of this research is to evaluate the extent to which universities’ strategic planning affects the level of incorporation of sustainability within the curriculum design and property portfolio. This paper aims to address the following research questions:

- What are the practical implementations for incorporating sustainability within the curriculum design?
- What are the practical implementations for incorporating sustainability in the property portfolio within the higher education sector?
- What are the good practices for engaging sustainability good practice within the curriculum design and property portfolio within the higher education sector?
- What are the areas of improvement for incorporating sustainability within the curriculum design and property portfolio in the higher education sector?

2. Literature Review

2.1 Sustainability literacy

The starting point for sustainability literacy is an appreciation of the current mode of production and way of life which is inherently unsustainable with far reaching immediate and long term implications on economy and society (Orr, 2004). Stribbe (2009) argued that human beings need to survive and thrive in challenging conditions and they require the skills and attributes to demonstrate ecological intelligence and technological appraisal whilst appreciating that there is no single way to enhance literacy levels. Two levels of learning are required to raise literacy levels. The first relates to a need for a holistic, multi-disciplinary appreciation of the core principles and implications of sustainability on decision making (Dawe et al., 2005). The second level focuses on exploring the importance of experiential learning and a real life understanding for its implications (Kolb, 1984). The following paragraphs will evaluate to what extent the current learning environment for sustainable construction are supported by these two levels.

Dixon et al. (2008)’s research findings highlighted that the Royal Institution of Chartered Surveyors (RICS) members have a low level of awareness and understanding of sustainable construction, a trend shared by other built environment professionals over the last decade (see CIOB, 2013; Dale, 2007 and RIBA, 2014). Built environment professional organisations have sought to promote sustainable construction within their professional competency framework over the last decade through developing associated CPD programmes for their members (Murray and Cotgrave, 2007). They also established it as an integrated requirement for their accredited degree courses aimed at developing new graduates to be sustainability literate (ibid.). Despite efforts on incorporating sustainability literacy as part of formal education, Gleeson and Thomson (2012) have challenged its actual use on enhancing built environment professionals’ capacity on sustainability literacy.
Gleeson and Thompson (2007) pointed out that promoting sustainable construction is as much about changing the mind-set and culture of its professionals as it is about developing skills to implement the technologies and new techniques.

There is also concern existing for construction professionals who have not been engaged in formal education in the last decade (or even at all) and have limited access to sustainability related training or professional CPD and the impact on their ability to achieve the necessary sustainability literacy. Learning within the built environment is primarily rooted in experiential learning (Kolb, 1984) focused on learning by doing through informal pathways to education associated with apprenticeships and other types of on-job training (Mathur et al., 2008). A question remains as to whether these often individually driven learning pathways effectively foster sustainability literacy.

The existing literature, such as Dixon et al. (2008), Gleeson and Thompson (2007) and Murray and Cotgrave (2007), highlighted that there is a combination of low level of sustainability literacy in the built environment sector and the challenges faced on developing the sector’s professionals’ sustainability literacy. Therefore, it is important to gain understanding on how to enhance the sustainability literacy of the professionals in the built environment sector, such as those who manage property portfolios for large organisations.

### 2.2 Sustainability and curriculum development

Fenner et al. (2005) examined the concept of embedding sustainable development into the teaching activities in the Department of Engineering at the University of Cambridge in the UK. The paper has discussed the reflections on the paradigms and pedagogy of teaching sustainable development issues to engineers and also highlighted the barriers to progress which have been encountered. The research finding of this paper is that the key for successful incorporation of a sustainable solution within the curriculum is that it is needed to be activated within the whole curriculum not taught as another specialism.

Murray and Cotgrave (2007) adopted a case study approach which focuses on the sustainability curriculum development in the University of Portsmouth and evaluated whether sustainability has become the operating paradigm for construction education in the UK. Murray and Cotgrave (2007) examined the viewpoints of the construction-related professions by analysing the accreditation policies of key professional bodies, such as the Royal Institution of Chartered Surveyors (RICS), Royal Institute of British Architects (RIBA), Royal Town Planning Institute (RTPI), Chartered Institute of Building (CIOB) and Chartered Institution of Building Services Engineers (CIBSE) and also conducted a survey with public sector-based UK building professionals to gather their views on incorporation of sustainability within the built environment sector. Murray and Cotgrave (2007) also conducted a survey of UK universities delivering construction degrees to explore the environmental content of construction courses. The research findings of this study showed that the sustainability agenda and construction are intricately linked in the built environment courses in the University of Plymouth. The reason for this success is because there are strong policy drivers for embedding sustainability into the curriculum despite the fact that the response from construction educators was patchy. Overall, this case study demonstrated that integrating sustainability issues within construction courses can be achieved if support from different stakeholders was received.

Shephard (2008) discussed the use of educational theories of the effective domain, such as values, attitudes and behaviours and relevant experience in other educational areas which could benefit the implementation of sustainability in higher education. The findings of this research are based on an analysis of literature reviews of relevant educational endeavours in affective learning. The finding of this research has emphasised the importance for the pursuance of achieving affective outcomes rather than simply focusing on enhancing the development of cognitative knowledge and understanding.
Chhokar’s (2010) research focused on investigating sustainable innovative curriculum development in India’s education sector. This research has compared different educational approaches in different higher education institutions in India, taking into account their educational philosophy, academic programmes, policy statements and education projects, to highlight important developments, challenges and the prospects for future progress in connection with education for sustainable development. The research finding showed that there is a high level of incorporation of sustainable development in India’s education policy. One of the reasons to explain the high level of incorporation is due to the fact that India is the only country where the Highest Court has mandated that environmental education is required to be incorporated at all levels of formal education, which includes offering a compulsory course at undergraduate level. However, there are still challenges existing for the effective embedding of sustainability within education as there is a lack of inter-disciplinary competence among staff and students and implications from limited resources. Chhokar (2010) concluded that ‘many efforts to develop learning opportunities in this field have emerged primarily from academic and student interests and priorities rather than from formal policy initiatives’ (p.141).

The findings of previous research on curriculum concluded that one of the key factors for successful incorporation of sustainability within the curriculum is to ensure it is incorporated within the whole curriculum, and not included as an additional specialism. Sustainability affects people’s life in many ways, therefore, a suitable approach to teach sustainability is to encourage students to view sustainability as a day-to-day issue not only as a technical subject. Finally, it is also important to have staff and student’s interest on the subject as it is the most effective mechanism for engagement.

2.3 Sustainability and campus development

Education for sustainable development is a contentious concept that has been present in many official agendas in higher education institutions for the last several decades. However, the research focusing on sustainability of campus buildings has not progressed as fast as expected (Velazquez et al., 2005). Despite some research on sustainability of campus buildings, the focus has been in South-east Asian countries and has mostly been in relation to new buildings rather than sustainable refurbishment and management of existing properties (Niu et al., 2010; Su and Chang, 2010).

Su and Chang’s (2010) research provides the rationale and context for recent national policy and funded initiatives, Taiwan Sustainable Campus Programme (TSCP), to support sustainability developments within higher education in Taiwan. This Programme addressed the sustainable development of the campus in both the practical and educational aspects. It is important to point out that this sustainability initiative was launched after a major natural disaster, the 921 earthquake in 1999. Therefore this programme has a strong focus on ensuring the reconstruction of the campus and enhancing its physical sustainability against the prospect of future natural disasters.

Niu et al. (2010) studied the Green Campus Plan implemented in Tsinghua University. Tsinghua University’s idea for a ‘green campus’ is more comprehensive than Su and Chang’s (2010) and the Green Campus Plan covered areas of education and facilities management. In other words, it considered education with green curricula, research with green science and technology, and green operations to influence student activities. Despite Niu et al. (2010) having more comprehensive ideas for sustainability, their focus on ‘building’ is still in regards of new buildings only and there is no consideration for sustainable property refurbishment and maintenance.
2.4 Challenges on successfully implementing sustainability

The first challenge for a successful implementation of sustainability is the lack of rigorous regulations and policy within an organization (Down, 2006; Littledyke et al., 2013; Velazquez et al., 2005; Wright, 2010). Velazquez et al. (2005) discussed the importance of policy leading the aims, objectives and procedures in fulfilling the goals. They also highlighted the need for more rigorous regulations for fostering education for sustainable development and they emphasize the need to have more enforcement of those regulations in order to effectively promote sustainability. Wright (2007) reinforced Velazquez et al.’s (2005) view and concluded that it will be difficult if not impossible to achieve success with regard to effective sustainability education policy enforcement and implementation if there is a lack of university’s management backing sustainability initiatives.

The second challenge is the lack of support from stakeholders and their resistance to change (Down, 2006; Littledyke et al., 2013; Velazquez et al., 2005; Wright, 2010). Down (2006) stated that in order to implement any change in a curriculum it requires the direct or indirect co-operation of a number of key stakeholders from the relevant educational institutions, particularly academic staff and students. He further stated that the challenges faced in attempting to mainstream sustainable development education in curriculum development were directly related to the lecturers’ concept, knowledge of and attitude to the subject, students' expectations and syllabus constraints. Students signing up for a course have expectations of particular content within a specific syllabus. In other words, a set of stated learning outcomes must be addressed in the course curriculum. If the lecturers attempt to re-orient that course to engage with sustainability issues, the students may perceive it as deviating from the focus of the course and have objections to this arrangement (Down, 2006). Velazquez et al. (2005) also highlighted the impact of resistance from administrative staff with regard to the implementation of sustainability development by stating ‘obtaining the support from university top management (on sustainable education development) should not be difficult. However, opposition from decision-making and administrative inertia are obstacles that come in the way of instituting solid programmes’ (p.386).

The other challenge for enhancing sustainability in higher education is financial constraint (Velazquez et al., 2005; Wright, 2010). The implementation of new initiatives, such as green campus, requires a substantial amount of resources upfront. Despite the potential savings to the operational cost of the building over its life cycle, the requirement for initial investment can still be a hindrance to its conception and subsequent successful implementation.

2.5 Incorporation of sustainability within the higher education sector in different countries

Sustainability has become an increasingly important issue for universities worldwide (Beringer et al., 2008). Some of the initiatives are directed by government’s legislative framework (Axelsson et al., 2008). From 1 February 2006 onwards, all universities in Sweden have been assigned an additional task by a new amendment to the Act on Higher Education in the opening paragraph (Act on Amendment of the Higher Education Ordinance, 2014: p.1096):

Institutions of higher education shall promote sustainable development in their activities meaning that present and future generations will be assured a healthy and good environment, economic and social welfare and justice.

This means that research and education at universities directed towards education sustainable development has become one of Swedish society’s prioritised fields on education and research (Axelsson et al, 2008).
The sustainability in higher education (SHE) research is still a relatively new and emergent area of inquiry in Canada. Researchers in this area have called for more documentation of university sustainability initiatives (Wright, 2007). Also, the SHE research in Canada has a more exploratory focus, for example, in-depth research and evaluation of SHE through the development of comprehensive case studies (Corcoran et al., 2004), problem-based research into the role which higher education can play in developing a sustainable society (Ubuntu Declaration on Education, 2002) and interdisciplinary sustainability research with real world application (Clugston and Caldar, 1999; Social Sciences and Humanities Research Council of Canada, 2002).

Wright and Horst (2013) examined the views of senior university staff in Canada on sustainability in higher education. The findings of their research demonstrated that despite senior staff having given thought to their own understanding of sustainable development, fewer of them had thought about the term sustainable university. The majority of participants in this research would have liked to see their institutions enhance their incorporation of sustainability in the areas of education, research and daily operations.

The Australian Government has also committed to ensuring that the priority of education for sustainability across Australia is being met. One of the actions for achieving this purpose was to establish the Australian Research Institute for Environment and Sustainability (ARIES) in 2003 and it has continued to do research to influence and inform Australian government policymakers on sustainability in education since then.

The use of policy, both at national and institutional levels, to influence and enhance the use of sustainability in the higher education sector is a common theme in different countries worldwide. The previous studies also acknowledged the importance of considering sustainability in education, research, estate management and daily operation within the higher education sector.

3. Research Methods

This research adopted a case study approach as this research aimed to explore the ‘how and why’ of incorporating sustainability in a higher education context (Gray, 2004) and also investigated ‘contemporary phenomenon within its real life context’ (Yin, 1994). Case study is a popular research method for sustainability research. Niu et al.’s (2010) research focused on Tsinghua University in China, Fenner et al.’s (2005) research focused on Cambridge University in the UK, Murray and Cotgrave’s (2007) focused on University of Plymouth in the UK and Muijen (2004) focused on Vrije Universiteit of Amsterdam in the Netherlands. The reason for the preference of using case study for sustainability in higher education (SHE) research is because institutional policy and structure has a major impact on SHE implementation. The use of the case study approach enables research to take these aspects into consideration and be able to identify a more comprehensive picture and draw up more robust research findings.

Validity and reliability were addressed in the research design and data collection. This research used multiple sources of evidence, including the University’s Strategic Plan, policy documents on sustainability, specifications of sustainability courses/units and interviews with stakeholders who have different responsibilities on sustainability within the university, with the aims to ensure constructive validity. The stakeholders who were interviewed in this research include the University’s Sustainability Team and Facilities Manager who has a specific responsibility for sustainability and academic colleagues who have a responsibility on curriculum development and enhancement. Previous research which investigated the university’s implementation of sustainability in higher education also used interviews as the primary data collection method (Wright, 2010; Wright and Horst, 2013). The advantage of using interviews as a data collection strategy for case study research is that the interviewees can provide important contextual
information about the case study organisation, as well as providing comments on the specific interview questions.

Furthermore, because data was collected from different stakeholders and also referenced to the relevant sustainability policy documents, it is expected inter-observer reliability is ensured. Triangulation of the interviews, desk-top analysis of documents and policy observations served as a verification procedure to confirm the credibility of the study results.

The purpose of the discussion with property colleagues is to identify the University’s current priorities and future plans for sustainable property development, refurbishment, maintenance and management. The discussion with the academic colleagues aims to identify the good practice on incorporating sustainability within the curriculum.

3.1 Case study institution– Deakin University in Australia

Sustainability is overtly recognised in Deakin University’s Strategic Plan, LIVE (Learning, Ideas, Values and Experience) Strategy (Deakin University, 2015). Sustainability 2020 is Deakin’s updated sustainability strategy. Sustainability 2020 advances Deakin’s sustainability initiatives in line with the University’s Strategic Plan LIVE the Future. Sustainability 2020 extends the definition and practice of sustainability in Deakin to include the triple bottom line considerations of economic, environmental and social measures. The interrelationships of the sustainability components support the LIVE Agenda. In recognition of Deakin’s on-going commitment to sustainability, Deakin’s sustainability goals are outlined as follows:

- Operations: To employ sustainability principles in all University’s decisions related to the use of facilities and spaces
- Learning: To incorporate sustainability principles into the curriculum to create global citizens
- Research: To ensure that research is undertaken in a sustainable manner, and establish research areas that contribute to sustainability globally

These components are incorporated and mutually influence the Deakin community. The Venn diagram stated in Figure 1 has provided further information on the interrelationship between LIVE strategy and triple bottom line sustainability measures.
Figure 1  Deakin University’s LIVE strategy and its interrelationship with triple bottom line sustainability measures and sustainable goals

Source: Deakin University (2015)

It is very clear in the University’s Strategic Plan that the institution has the intention to consider sustainability within the operation of the organisation, courses curricula and research. ‘Sustainability’ within the context of this paper can be seen as: (1) the incorporation of core sustainability drivers into the curriculum, and (2) incorporating and promoting within the operation of the organisation, which is to focus on the development, refurbishment, management and maintenance of the property portfolio. Incorporation of sustainability within research was not considered in this paper. This is because conducting research on sustainability or incorporating sustainability within research projects is more likely to happen at an individual level. Therefore, the author has decided not to include the evaluation of incorporation of sustainability within research as this paper adopts a case study approach with an institutional focus.

3.2 Data collection and analysis

This research adopted a qualitative approach, and used a purposeful sampling method to identify the respondents who were best suited to provide detailed information on the subject matter (Savelyeva and McKenna, 2011). The interviewees included academics who have course development and management responsibility within the University, colleagues who have a sustainability-focused role in estate management and also colleagues whose role is managing sustainability initiatives at institution level. The nine interviewed colleagues include:

1. Colleague who has a role on Teaching and Learning at institutional level
2. Associate Dean for Teaching and Learning
3. Associate Head for Teaching and Learning
4. Head of School
5. Course Director for a cross-Faculty course
6. Unit chair and teaching staff for cross-institutional sustainability unit
7. Course leader for a course which has Major in sustainability
8. Institutional Sustainability Team
9. Facilities manager who has specific responsibility on sustainability

The interview 6 and interview 8 are group interviews and two interviewees were involved on each occasion. Interview 6 was conducted with the unit chair and the lecturer of the cross-institutional sustainability unit and interview 8 was conducted with the Sustainability Manager and Sustainability Officer.

The interview discussion consisted of four areas. The questions to the academics and the property services colleagues are basically the same, the only difference is that the questions for academics are focused on curriculum design while for property services colleagues are focused on property development, refurbishment, maintenance and management. The interview questions are listed in Table 1.

**Interviewees’ views on incorporating sustainability within the curriculum (or property portfolio)**

- In your opinion, why do you think it is important to incorporate sustainability into the curriculum?
- What do you think is the best strategy for incorporating sustainability into the curriculum?
- What are the challenges/obstacles on incorporating sustainability into the curriculum?
- What is your view on the enhancement of student employability through the incorporation of sustainability into the curriculum?

- In your opinion, why do you think it is important to incorporate sustainability into the property portfolio?
- What do you think is the best strategy for incorporating sustainability into the property portfolio?
- What are the challenges/obstacles on incorporating sustainability into the property portfolio?
- What is your view on the enhancement of the University’s image and reputation through the incorporation of sustainability into the property portfolio?

**Good practices/Case studies**

- Are you aware of some courses, units or examples which you would define as good practice on embedding sustainability into the curriculum?
- Are you aware of some of the examples (new property development, refurbishment, maintenance or management projects), which you would define as good practice on incorporating sustainability into the property portfolio?

**Additional comment**
Each participant was interviewed once in a face-to-face setting. All interviews were digitally recorded and transcribed with the permission of the participants. Content analysis was used to analyse the interview data. Data coding and analysis took place after all interviews were complete. The data was analysed and themes were identified (McCracken, 1998). The policy and course documents were reviewed to identify common themes and topics which address each research question.

4. Research Findings and Discussions

4.1 University's practical implementations for incorporating sustainability within the curriculum design

Practices for incorporating sustainability within the curriculum varies vastly among different courses and units in the university, some courses or units have heavily incorporated sustainability throughout the whole curriculum across different degree levels while some courses or units do not even mention it. Unit in an Australian context means module in the UK higher education system. The incorporation of sustainability has depended very much on individual teaching staff's initiatives and the nature of the course or unit. For example, built environment courses and units are more likely to incorporate sustainability into the curriculum as there is a strong link between sustainability and building. However, with the shortening of the trimester, it becomes more difficult to add or incorporate new content, such as sustainability, into the curriculum. The University runs a trimester system. In the past, there were 13 weeks in one trimester. This was reduced to 12 weeks in the early 2010s and then down to 11 weeks from 2013. The comment about adding sustainability as new content in the curriculum demonstrated the University had not implemented one of the important strategies on the incorporation of sustainability within curriculum as identified by Fenner et al. (2005).

One of the reasons causing this unsystematic incorporation of sustainability within the curriculum was due to the lack of institutional requirement for it. Despite the necessity to incorporate sustainability within the curriculum being mentioned in the University's Strategic Plan, there was no strict procedure or policy on assuring sustainability had been incorporated into the curriculum. There was also the lack of quality assurance mechanisms to ensure sustainability had been incorporated into all courses and modules. However, the real picture on incorporating sustainability may not be as insufficient as it has been described above. Interviewee 3 provided rationale to explain the situation ‘I don't think a lot of academic colleagues have a detailed understanding on what is meant by sustainability. They might teach sustainability in their units but they do not realize it or call it sustainability. For example, the unit ‘Accounting for Intangibles’ focuses on creating responsibility in society and it is a sustainability concept. However, the teaching staff of this unit do not call it ‘sustainability’ and therefore they do not think they have incorporated sustainability in the curriculum’.

There is also some innovative practice on incorporating sustainability within the university curriculum. There is a specialist sustainability unit, which is called ‘Creating Sustainable Future’. This unit is a cross-faculty unit involving all faculties of the University. This unit is compulsory for the students who study for a Major in sustainability. Students who study in other disciplines can study this unit as an optional unit.

A problem-based approach has been used as a delivery mechanism for this unit. The problem-based approach has been identified by the United Nations as a suitable method for developing a sustainable society (Ubuntu Declaration on Education, 2002). The delivery of this unit involved academics from different disciplines across the University. The academics provided guest lectures throughout the whole unit, which were aimed at addressing sustainability with different disciplines focus, such as property, construction, engineering, health and education etc. The University's
Sustainability Office and Facilities Service Division also provided support for this unit. These two departments provided real life projects for students to use as ‘case studies’ for their project work in order to offer them an authentic learning experience on sustainability. Students are also encouraged to identify real life projects from their industrial partners in the discipline. For example, one of the projects that students did in the past was managing a site for the building structure and managing wastages. The students did a project plan which provided detailed information on the cost required, milestones and quality specification, and finally handed over the finalised plan to the project principal. Group work is used as part of the assessment plan. Students are asked to form an inter-disciplinary team to explain sustainability and explore solutions, which is another successful pedagogical technique on sustainable higher education as mentioned in Clugston and Caldar (1999) and Social Sciences and Humanities Research Council of Canada (2002).

In addition to developing students’ practical actions and intellectual knowledge on sustainability, this unit also developed students’ understanding of sustainability at an emotional level. A model called ‘Head, Hands and Heart’ was created as part of this unit. Students were required to do journal writing and reflect on how sustainability affects people in a wider context. The purpose of this journal writing exercise was to inspire students to think sustainability is not the only issue for environmental science, but an issue for humanity. The focus of encouraging students to think of sustainability with emotion has echoed Shephard’s (2008) pedagogical viewpoint on educating sustainability. This pedagogy method also encouraged students to address the social aspect of the triple bottom line sustainability measures. Interviewee 7 summarised the principle on incorporating sustainability within the curriculum, she stated ‘my philosophy in teaching is to get students in real life and real situations. Because sustainability is so broad, I encourage students to pick units through their course to get them into the focus of their interest’.

On the other hand, the change of the University’s Graduate Learning Attributes has made sustainability become a less obvious institutional education objective. In the past, sustainability was one of the nine University’s Graduate Learning Attributes. The University has changed to have eight Deakin Graduate Learning Outcomes (DGLOs) from 2013. Sustainability is no longer an independent DGLO. Instead, the concept of sustainability has been considered as one of the three elements in DGLO6 Global Citizenship, with Internationalisation and Ethics as the other two elements. In other words, sustainability has become a less obvious university required learning outcome after the change. Interviewee 7 expressed her concern on it. She stated ‘I think the University is going backwards, although it has signed up to commitment of sustainability. But sustainability as one of the University Learning Attributes has disappeared after the changes to Deakin Graduate Learning Outcomes’.

There is a general view that Deakin University has more focus on the environmental and physical aspects of the sustainability management, such as having a smoke free campus and providing shuttle buses etc. However, there is not much attention paid to incorporating sustainability within education and curriculum development. This view has been shared by several interviewees. Interviewee 3 stated that ‘there is no sustainable education development model in the university, although sustainability has been considered within the University’s operation model’. The interviewees have a general view that the University does not provide clear direction and guidance on how to ensure sustainable education. They commented that although the staffs in the University were told of the necessity to incorporate sustainability within the education system, sometimes it is only a box ticking exercise and there is little or no oversight. This comment can be reinforced by the remark of Interviewee 5, who is a Course Director for the two largest cross-Faculty business management courses in the University. She stated that she has not seen sustainability being considered as a key factor incorporating within the curriculum of the two courses since she has been in the Course Director role. She considered this as a sign that sustainability is not important in the agenda. In terms of Business Subject area, there is a lot of research and textbooks on the area of sustainability, but this is not really incorporated within the curriculum. Interviewee 5 further commented that ‘it is not sustainability being ignored, but it is
snapped. In the new cross-Faculty programme we developed, we have not created a unit called Sustainability but we have developed a unit called Corporate Social Responsibility. The challenge is to provide a clear definition of sustainability’. This comment reinforced the earlier comment, that academics lack understanding on the definition of sustainability. This view is further reinforced by Interviewee 2’s comment. Interviewee 2 is an Associate Dean for Teaching and Learning and he has been working in the University since 1996. He was a Course Director and also Associate Head for Teaching and Learning for eight years prior to taking up his current role. He is involved in all aspects of course development and enhancement. He also has extensive experience on policy development on courses and assurance of learning. He was surprised that the questions about incorporating sustainability within the curriculum and sustainable education development are so new to him and that his knowledge on this aspect was so limited.

4.2 University’s practical implementations for incorporating sustainability in the property portfolio within the higher education sector

The University has adopted a realistic approach and aimed for cost effectiveness when incorporating sustainability within its property portfolio. The University used a design standards approach to maintain sustainability in the property portfolio. The University required that every new building and refurbishment project must have some level of sustainability incorporated into its design in order to achieve a 5 Green Star rating. The University usually uses external consultants who are familiar with the University’s design standards on specific tasks in order to ensure stability of finance and quality. The University also aims to increase the Green Star rating for existing buildings to five stars through refurbishments and redevelopment projects. This demonstrates that the University has a clear commitment to ensure the environmental aspect of the triple bottom line of sustainability is met. The University also showed a higher commitment to incorporating sustainability into the property portfolio, as compared to the other universities mentioned in literature such as Su and Chang’s (2010) and Niu et al. (2010), which focus mainly on ensuring sustainability on new build projects.

Despite the fact that there are higher sustainability ratings, up to 7 stars, available, the University was not inclined to achieve a 6 or higher Green Star rating as the additional investment to achieve this is not considered cost effective. In addition to ensuring sustainable property development and refurbishment, the University also paid attention to sustainable property maintenance and management and reducing energy consumption, such as using alternative energy sources, like solar power, solar hot water and window shielding, etc. Ultimately, the University’s approach to ensuring sustainability in the property portfolio is largely a financial decision, which demonstrates the University’s commitment to achieve the economic aspect of the triple bottom line of sustainability measures. Interviewee 9 pointed out that sustainable building is usually more expensive to build but at the same time, has lower running costs over the long term, than comparable non-sustainable buildings. The question is how the University secures the additional initial financial investment at the beginning of the construction project. This comment links back to an earlier point, which is that the University aims for properties with a 5 Green Star rating instead of 7 stars due to the financial implications in the initial development stage. The previous studies, such as Velázquez et al. (2005) and Wright (2010), have also raised financial concerns for initial investment possibly being a hindrance for incorporating sustainability in the property portfolio in the higher education sector.

4.3 Good practices for engaging sustainability good practice within the curriculum design and property portfolio within the higher education sector
Reflecting on the practical implementation of incorporating sustainability within the curriculum and property portfolio in the University, there are some good practices which have been identified and are applicable to the wider higher education sector.

The first good practice for engaging sustainability within the curriculum is the use of a problem-based approach as a delivery mechanism for ‘Creating Sustainable Future’. The involvement of colleagues from the Facilities Services Department and Sustainability Office and the encouragement to students using real life projects as case studies for this unit has enhanced the students' authentic learning experience. As this is a cross-institutional sustainability unit, it has involved the contributions of academics from different disciplines and has clearly demonstrated to the students that sustainability is not only relevant within academic disciplines but also within their daily lives. The multiple disciplines delivery approach has further reinforced that sustainability is an important concept in different disciplines, and not necessarily restricted to their own discipline.

A key good practice for successfully incorporating sustainability into the property portfolio is that the University has a clear vision on what it has planned to achieve, which is to ensure a balance between sustainability and value for money. This was commented upon in previous literature, such as Littledyke et al. (2013) and Velazquez et al. (2005). Velazquez et al. (2005) discussed the importance of having clear goals and also having policies and procedures to support the achieving of these goals. The University's realistic implementation plan, which is to ensure all buildings achieve a 5 Green Star rating, through initial construction, redevelopment or refurbishment, is also a realistic goal.

4.4 Areas of improvement for incorporating sustainability within the curriculum design and property portfolio in the higher education sector

Same as the identification of good practices, there are also some areas of improvement which have been identified and are applicable to the higher education sector.

It is important to have a strategic plan to list out what is expected from incorporating sustainability within the operation of an organisation. However, it is even more important to have a clear connection between policy and implementation in order to ensure successful implementation of the strategic plan, and be able to enforce implementation at a local level. The University has successfully implemented this Strategic Plan in the property portfolio management (see Section 4.3) but the implementation within the curriculum is polarised. There is successful incorporation of sustainability in some courses or units in the University but sustainable higher education is a relatively unheard concept in other parts of the University. In order to enhance the comprehensive incorporation of sustainability across the whole university, it is important to develop an institutional culture on incorporating sustainability within the curriculum. As mentioned by Velazquez et al. (2005), the senior management’s backing is important but is not sufficient for the successful incorporation of sustainability within the curriculum and instituting solid programmes, the support of stakeholders, such as teaching staff, students and administrative staff are also the other key elements for success.

It is also important to enhance staff and students understanding of the definition and importance of sustainability. As pointed out by Interviewee 3 (see Section 4.1), colleagues actually have incorporated sustainability within the curriculum at a higher level than they realised. Therefore, their current claim of incorporating sustainability within the curriculum is understated. The students also need to be reminded that sustainability is an important issue. The incorporation of sustainability within the curriculum is not aimed to re-orient their learning, but to enhance their learning experience (Chhokar, 2010; Down, 2006).
Finally, better communication of identified good practice across the institution, more systematic evaluation on the incorporation of sustainability and identifying lessons learnt are also required. For example, there are some good practices on incorporating sustainability in the ‘Creating Sustainable Future’ unit, such as using a problem-based learning approach, real life projects and forming students into inter-disciplinary teams for group assignments. These good practices should be captured and disseminated widely within the University.

5. Conclusions

Sustainability literacy for professionals, such as the built environment sector, have been at a struggling low level for the last several decades (Dixon et al., 2008). At the same time the sector has faced the challenges of developing the professionals’ sustainability literacy (see Section 2.1). Therefore, it is important to gain understanding on the good practice of incorporating sustainability within the curriculum of university courses, in order to increase professionals’ sustainability literacy. Real estate is one of the key assets for large organizations, such as universities and the use of building has a major impact on sustainability, both at the construction stage and whole life-cycle of using the building. Therefore, it is important to investigate the strategy on sustainable development, management and maintenance of property portfolios.

This paper adopted a case study approach to evaluate Deakin University’s Strategic Plan and how it affects the level of incorporation of sustainability within the curriculum design and property portfolio. The University has a clear sustainability strategy, Sustainability 2020, and it has been explicitly recognised in Deakin University’s Strategic Plan: LIVE Strategy. Deakin’s sustainability goals focused on the aspects of operations, learning and research. This research is pioneering, investigating the incorporation of sustainability into higher education in a more comprehensive way and considering the impact of strategic planning on the incorporation of sustainability within the sector, on both curriculum design and property portfolio management. It is expected the findings of this research will be useful for the university sector to develop strategies to incorporate sustainability within the curriculum and property portfolio.

Despite the University having clear strategic aims and initiatives for the incorporation of sustainability within the organisation, there is disconnection between policy development and policy implementation and the incorporation of sustainability varies largely within the institution. The incorporation of sustainability within the property portfolio is clear and effective. The University has a realistic but not over-ambitious target which is to achieve a 5 Green Star rating for all new built and refurbishment projects and also ensure sustainable property management. There is also a clear consideration on the balance between achieving sustainability goals and their financial implications. However, the incorporation of sustainability in the curriculum is polarised. Some parts of the university really drive it and ‘Creating Sustainability Future’ is a very successful example. On the other hand, the incorporation of sustainability within the curriculum is inconsistent in other parts of the University. The driver for incorporating sustainability within the curriculum very much depends on the nature of the course and individuals’ initiatives. Furthermore, the academic managers’ knowledge and understanding of sustainability was also quite limited as some of the interviewees did not know the definition of sustainability.

In order to effect a successful implementation of incorporating sustainability within the curriculum, it is important to have support from all stakeholders, including academics and students. For the academics, the sharing of their positive personal experiences and good practice with the incorporation of sustainability within the curriculum is a suitable way to encourage their peers to do the same. One of the ways to encourage students to support the incorporation of sustainability into the curriculum is through recognising and rewarding their achievement. For example, awarding badges to students who have engaged in sustainability. Although badges cannot be transferred to
credit for their degree, it is still a way of recognizing their achievement and they can still include it in their resume.

The limitation for this research is that it was based on the experience of one single institution, which limits the generalizability. Having said that, this research highlighted some lessons learnt which are required for the successful incorporation of sustainability within the curriculum design and property portfolio in the higher education sector.
